Stress and Eating: Disentangling the Effects of Psychological, Autonomic and Endocrine Components of Stress Response

Zhenfeng Ma, McGill University

Laurette Dube, McGill University

Using a psychophysiological approach to stress, this study examines the joint effects of psychological, autonomic and endocrine reactivity on consumer food preference under stress through a randomized controlled study. Stress was manipulated using guided mental imagery technique. Consumer showed increased preference for high energy-density snack foods in the stress vs. control condition. The changes in food preference were jointly predicted by psychological, autonomic and endocrine responses. A model comparison approach shows that the inclusion of autonomic and endocrine responses contributed incrementally to the prediction of food preference. Theoretical and practical implications are discussed.

ABSTRACT
Using a psychophysiological approach to stress, this study examines the joint effects of psychological, autonomic and endocrine reactivity on consumer food preference under stress through a randomized controlled study. Stress was manipulated using guided mental imagery technique. Consumer showed increased preference for high energy-density snack foods in the stress vs. control condition. The changes in food preference were jointly predicted by psychological, autonomic and endocrine responses. A model comparison approach shows that the inclusion of autonomic and endocrine responses contributed incrementally to the prediction of food preference. Theoretical and practical implications are discussed.
